

Complete Angular Interview Roadmap

Senior → Architect Level (Angular 9 → Angular 21)

This roadmap is designed for developers with 5+ years of real enterprise Angular experience. It focuses strictly on interview expectations, real production problems, and architectural thinking — not tutorial-style explanations.

Phase 1 — Beginner Baseline (Interview Critical)

- Angular bootstrapping and application startup flow
- Component lifecycle hooks with real production usage
- Dependency Injection hierarchy and provider scopes
- Routing, lazy loading, guards, resolvers, preloading
- HttpClient, interceptors, retries, cancellation
- Observable vs Promise, async pipe usage

Common Interview Mistakes (Phase 1)

- Using subscribe everywhere without unsubscribe
- API calls inside constructors
- Not understanding provider scopes
- Heavy logic inside templates
- Memory leaks due to missed cleanup

Mock Interview Questions (Phase 1)

- Explain Angular DI hierarchy with a production example
- Design JWT interceptor with refresh token handling
- Why does async pipe prevent memory leaks?
- Observable vs Promise — when is Promise a bad choice?
- How do you cancel HTTP requests in Angular?

Phase 2 — Intermediate (Enterprise Reality)

- Change Detection strategies: Default vs OnPush
- Immutability rules and UI update behavior
- RxJS operator selection and pitfalls
- shareReplay caching strategy
- Reactive Forms and Dynamic Forms architecture
- FormControlValueAccessor for reusable components
- State management boundaries

Common Interview Mistakes (Phase 2)

- Wrong RxJS operator causing race conditions
- Overusing global state management
- Using any in forms
- Duplicate API requests
- Caching errors unintentionally

Mock Interview Questions (Phase 2)

- Why does your API call trigger multiple times?
- Design a dynamic form engine
- Explain OnPush with a broken UI case
- How do you cache API responses safely?
- Service vs Store — when and why?

Phase 3 — Advanced (Senior Level)

- Angular rendering internals and template performance
- TrackBy and DOM optimization
- Signals mental model
- RxJS and Signals interop
- Performance profiling
- Bundle optimization
- Security: XSS, CSRF, token storage
- Testing strategies

Real Production Debugging Scenarios

- Memory leaks after navigation
- Spinner stuck issues
- ExpressionChangedAfterItHasBeenCheckedError
- Stale data bugs
- Refresh token race conditions

Mock Interview Questions (Phase 3)

- Signals vs RxJS usage boundaries
- How do you debug memory leaks?
- Explain refresh token concurrency
- How do you measure UI performance?
- How would you modernize Angular 9?

Phase 4 — Architect (Tech Lead / Staff Level)

- Domain-driven UI architecture
- Shared vs feature libraries
- Scalable state and caching
- Angular 9 → 21 modernization plan
- Team conventions
- Performance budgets
- Observability

Mock Interview Questions (Phase 4)

- Design Angular architecture for a banking platform
- Prevent frontend monolith growth
- Legacy Angular modernization strategy
- Enforcing performance standards
- Production incident triage process

How to Use This Roadmap

- Prepare real production stories
- Explain trade-offs clearly
- Focus on debugging and performance
- Speak like an owner
